

# TECHNICAL DATA URETEK POLYMER

### **PRODUCT DESIGN**

URETEK polymer is a two component high density expanding thermoset polymer system formulated for the under sealing, void filling & lifting of settled pavement/concrete, the stabilizing & stiffening of weak soils, and for the encapsulation & sealing of buried infrastructure. polymer coupled with minimally invasive injection techniques achieves permanent repairs without the necessity of excavation or demolition.

## STORAGE AND HANDLING

URETEK polymer components have a shelf life of 1 year when stored at 60 - 80°F out of direct sunlight and extreme humidity, >80% RH. Polymer "A" component is water sensitive and caution must be taken to ensure "A" component is not exposed to moisture. If material remains in a receptacle be sure to tightly seal lid to minimize moisture exposure.

The "A" and "B" components should not be stored in temperatures less than 50°F for prolonged periods. Some phase separation in the "B" component may be noticed at these temperatures. If there is phase separation the material must be warmed and thoroughly mixed prior to use. Consult URETEK for proper warming and mixing guidelines. If the "A" component is allowed to crystallize or separate from exposure to cold temperatures, it is not useable and must be replaced.

## PRODUCT TYPE

URETEK polymer is capable of expanding up to 25 times its original starting volume in unconfined conditions. Fully cured polymer material is inert and non-toxic URETEK polymer are formulated in various densities and expansive coefficients for specific project applications. The low viscosity & lubricity of the polymer allows for easy penetration into soils while compacting surrounding soils and displacing water without detrimental dilution or loss of dimensional stability to the resin system.

URETEK polymer has a patented chemical composition that allows for direct application into water or very damp regions while still maintaining good physical properties. The patented chemical nature of polymer goes beyond available hydroinsensitive technologies currently available. Polymer will form proper linkages even while being injected directly into water. This property makes it ideal for lifting and stabilizing in areas with elevated soil moisture. The monolithic and hydro-insensitive nature of polymer the grout will resist under ground water erosion or weakening.

#### PROCESSING PARAMETER

URETEK polymer is a two component system that must be applied with a proportioning unit designed to allow 1 to 1, by volume, metering of materials. The proportioning equipment must be capable of maintaining recommended injection temperatures and pressures.

#### **SAFETY PRECAUTIONS**

Appropriate literature has been assembled which provides information concerning the health and safety precautions that must be observed when handling polymer components. Before working with these products, you must read and become familiar with the available information on their hazards, proper use, and handling. Information is available in several forms, e.g., material safety data sheets and product labels.

## **CREDENTIALS**

Certain URETEK Polymer utilizes a fully EPA approved, non-CFC, non-HFC, zero ozone depleting blowing agent. Certain URETEK Polymer is NSF 61 certified, approved for injection in and around public water supplies.
